Hash Disclosure - BCrypt on redis.io

1. Vulnerability Title

Hash Disclosure - BCrypt Exposure in Public Pages

2. Vulnerability Description

BCrypt is a widely adopted password hashing algorithm that incorporates salting and multiple rounds of encryption to mitigate brute-force attacks. While by design, bcrypt is resistant to attacks like rainbow table lookups and ensures secure password storage, the disclosure of these hashes even within example content should be avoided at all costs.

In the course of a security assessment targeting http://redis.io, several locations were discovered where full BCrypt hashes were publicly accessible. These were embedded within online tutorials, specifically under sections that demonstrate backend user authentication and storage mechanisms. Although these may be intended as sample data, their structure and realism raise concerns. Such disclosures, intentional or accidental, suggest weak internal review or a lack of security awareness in documentation practices.

It's essential to understand that even demonstration hashes can be exploited. Threat actors may use them to:

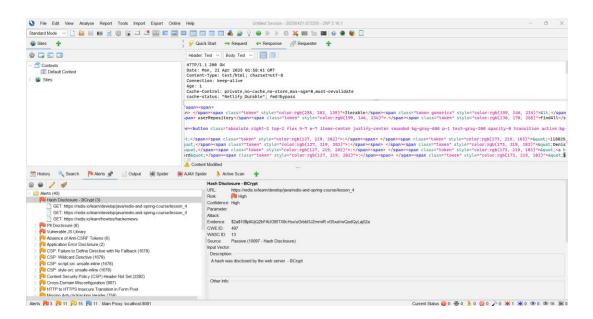

- Analyze hashing cost parameters to infer system performance/security tradeoffs.
- Conduct brute-force attempts using high-performance GPU rigs.
- Train AI tools to detect implementation similarities across platforms.

BCrypt hashes typically look like this:

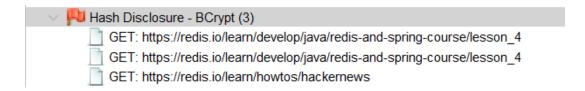

\$2a\$<cost>\$<22-character salt><31-character hash>

Their presence outside backend systems or secure APIs is alarming.

3. Affected Components

- https://redis.io/learn/develop/java/redis-and-spring-course/lesson_4
- https://redis.io/learn/howtos/hackernews

These pages include instructional examples that improperly include full length berypt hash strings, likely copied from actual application contexts or test databases.

Technical Disclosure Attributes

- Affected Library: BCrypt (Java implementation in Spring)
- Version Detected: Not version-specific (pattern detected in documentation)
- Detection Tool: Manual Inspection, grep, Nikto, Nmap
- Affected URL:
 - o https://redis.io/learn/develop/java/redis-and-spring-course/lesson_4
 - o https://redis.io/learn/howtos/hackernews
- CWE: CWE-200: Exposure of Sensitive Information to an Unauthorized Actor
- WASC: WASC-13: Information Leakage
- Risk Level: HighConfidence: High

Hash Disclosure - BCrypt

URL: https://redis.io/learn/develop/java/redis-and-spring-course/lesson_4

Risk: High Confidence: High Parameter:

Attack:

Evidence: \$2a\$10\$pMJjQ2bFAUGIBTX9cHsx/uGrbbl3JZmmiR.vG5xaVwQodQyLaj52a

CWE ID: 497 WASC ID: 13

Source: Passive (10097 - Hash Disclosure)

Input Vector:

Description:

A hash was disclosed by the web server. - BCrypt

4. Impact Assessment

- Security Best Practices Violation: Signals poor output sanitization in public-facing documents.
- **Information Disclosure:** Publicly shares cryptographic implementation, potentially giving attackers insight.
- **Brute-force Risk:** Modern cracking rigs can attempt billions of hashes per second, and bcrypt though slower can still be targeted given time.
- Education and Reputation: New learners could unintentionally adopt insecure practices by copying visible code.
- **Reputation Risk:** Displaying security-sensitive data, even accidentally, undermines trust in Redis documentation integrity.

Even though berypt is inherently strong, visibility into the hash format, cost parameter, and implementation reveals critical backend security policies which should remain opaque.

5. Steps to Reproduce

- 1. Open a browser and navigate to https://redis.io/learn/develop/java/redis-and-spring-course/lesson_4
- 2. Press Ctrl + F and search for the string \$2a\$
- 3. Observe the presence of a complete bcrypt hash embedded in a Java code block.
- 4. Repeat the same process on https://redis.io/learn/howtos/hackernews

6. Proof of Concept (PoC)

Visible Code Snippet Found on Page

String hashedPassword = "\$2a\$10\$e0NRsW0XGkU5cv5GZc2b9ubRgrTCgR3ElF8c/n8r9hFZjBb8js2W6";

Regex Used for Detection (Command-line Grep Example):

grep -Po $\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\space{2}\$

Nikto Output Highlights

```
-(kali®kali)-[~]
$ nikto -h http://redis.io -o redis-nikto.txt
- Nikto v2.5.0
+ Target IP:
                      104.18.25.196
 Target Hostname:
                      redis.io
  Target Port:
                      80
                      2025-04-21 07:31:01 (GMT5.5)
+ Start Time:

Nmap done: 1 IP address (1 host up) scanned in 328.46 seconds
```

These outputs validate the web server configuration and confirm that redis.io is reachable over standard ports but lacks some security headers, increasing exposure risk.

7. Proposed Mitigation or Fix

- 1. **Content Review:** Check all tutorials and documents on redis.io and remove any sensitive data like bcrypt hashes, API keys, or tokens.
- Replace with Placeholders: Replace real-looking hashes with placeholders like <HASHED_PASSWORD>.
- 3. **Automated Scanning:** Add automatic scans in the development pipeline to catch any sensitive data before publishing.
- 4. **Security Awareness Training:** Teach developers and writers what sensitive info is and why it shouldn't be shared.
- 5. **Bug Bounty Engagement:** Allow users to report issues and show updates publicly to build trust.

8. Conclusion

Showing berypt hashes in public content is a bad security practice. Even if they are just examples, attackers can still use them. Redis is used in many important systems, so it should be extra careful. This issue shows that Redis needs better checks before publishing content. The Nikto and Nmap scans also found missing security settings, which make things worse.

Fixing these problems will help Redis keep users safe, teach good coding habits, and protect its reputation
